

What is claimed is:

1. A method to calculate an element  $R(x,y)$  of a viewpoint-independent spatial covariance matrix of a given object in a database for infinitely dense sampling of illumination conditions, the method comprising:

calculating  $E(u_x, u_y, c)$ , an integral over all possible light directions, weighted by their respective intensities, according to the equation:

$$E(u_x, u_y, c) = \int_{n \in S^2} L(n) D(n, p, q)$$

where  $n \in S^2$  is a particular direction on the unit sphere,  $S^2$ , where  $L$  is the light intensity and  $n$  is a normal vector on the unit sphere  $S^2$ , where  $u_x$  and  $u_y$  are the unit vectors of the special coordinate system defined by  $p$  and  $q$ , where  $p$  and  $q$  are vectors in which the x-axis is the bisector of the angle,  $2\theta$ , between them, where  $p = (c, +s, 0)$  and  $q = (c, -s, 0)$ , where  $c = \cos\theta$ ,  $s = \sin\theta$ , and  $(x,y)$  is the image point;

solving for the viewpoint-independent spatial covariance matrix  $R(x,y)$  according to the equation:

$$R(x,y) = \alpha(x)\alpha(y)E(u_x, u_y, c)$$

where  $\alpha(x)$  is the intrinsic reflectance at the image point  $x$  and  $\alpha(y)$  is the intrinsic reflectance at the image point  $y$ ; and

tabulating and storing the result of said viewpoint-independent spatial covariance matrix  $R(x,y)$ .

2. A method to calculate an element  $R(x,y)$  of a viewpoint-independent spatial covariance matrix of a given object where there is no preferred direction in the illumination, the method comprising:

calculating  $E(c(p(x), q(y)))$ , according to the equation:

$$E(c) = \int_{n \in S^2 \cap \{C(n, c) > 0\}} c^2 n_x^2 - (1 - c^2) n_y^2$$

where  $n \in S^2$  is a particular direction on the unit sphere,  $S^2$ , where  $C(n, c)$  is the joint-visibility condition, where  $n$  is the given direction, where  $p$  and  $q$  are vectors in which the x-axis is the bisector of the angle,  $2\theta$ , between them, where  $p = (c, +s, 0)$  and  $q = (c, -s, 0)$ , where  $c = \cos\theta$ ,  $s = \sin\theta$ , and  $(x, y)$  is the image point;

solving for the viewpoint-independent spatial covariance matrix  $R(x, y)$  according to the equation:

$$R(x, y) = \alpha(x)\alpha(y)E(c(p(x), q(y)))$$

where  $\alpha(x)$  is the intrinsic reflectance at the image point  $x$  and  $\alpha(y)$  is the intrinsic reflectance at the image point  $y$ ; and

tabulating and storing the result of said viewpoint-independent spatial covariance matrix  $R(x, y)$ .

3. The method of claim 2, comprising:

using the Monte Carlo procedure to evaluate the integral for  $E(c)$  in claim 2.

4. A method for finding a set of  $Q$  pairs of reference values for the albedo and normals,

$\{\{\hat{\alpha}_q, \hat{q}\}\}_{q \in Q}$ , such that the perturbations are smallest for a given value of  $Q$ , the method

comprising:

using vector quantization algorithms to cluster a set of vectors

$\{(\alpha(x), p(x))\}_{x \in V}$  together in  $Q$  clusters;

finding the centroids  $\{\{\hat{\alpha}_q, \hat{q}\}\}_{q \in Q}$  of said clusters such that the average distance from

the vectors to the nearest respective cluster-centroid,  $q(x) \equiv q_x$ , is minimal, where  $\hat{\alpha}_q$

is a reference albedo to an albedo  $\alpha(x)$ ,  $\hat{q}$  is a reference normal close to a vector normal to the surface,  $p(x)$ , and  $x$  is a point on the surface of an object; and storing the results.

5. The method of claim 4, comprising:

using a Linde-Buzo-Gray algorithm as said vector quantization algorithm.

6. The method of claim 4, comprising:

using a Deterministic Annealing algorithm as said vector quantization algorithm.

7. A method to generate a low-dimensional basis of the viewpoint-dependent illumination subspace from the pre-computed viewpoint-independent hierarchy of eigen-surfaces, the method comprising:

generating and diagonalizing said object's vector-quantized viewpoint-independent covariance matrix  $R_Q$ ;

determining the eigenbasis hierarchy defined on the surface of the object from the results of  $R_Q$ , using the equation:

$$R(u, v) \approx \sum_{r=1}^Q \psi_r(u) \sigma_r^2 \psi_r(v)$$

where  $Q$  is the desired complexity, where  $\sigma_r^2$  is the non-increasing eigenspectrum of the spatial and the temporal covariance matrices, where  $\psi_r(u)$  and  $\psi_r(v)$  are the respective orthonormal eigenvectors of said spatial and temporal covariance matrices, and  $(u, v)$  is a point on the surface of the object;

choosing a cutoff,  $N$ , such that the average residual signal power,  $trR_N$ , is between the values of 0.1 - 10;

keeping only the first  $N$  eigensurfaces and storing the results for subsequent use;

warping said stored  $N$  eigensurfaces to a basis of the viewpoint-dependent illumination subspace at the viewpoint-dependent stage using the equation:

$$\tilde{\Psi}_r(x) = \tilde{\Psi}_r(x(u))$$

when a query at a particular viewpoint needs to be matched to the objects in said database; and

storing the results.

8. The method of claim 7, further comprising the step of finding  $M$ , the final dimensionality of the viewpoint-dependent eigen-subspace, the method comprising:

warping a viewpoint dependent, non-eigen-subspace of dimensionality  $N$  from a viewpoint independent eigen-subspace of dimensionality  $N$ ; and

finding the leading  $M$ -dimensional viewpoint dependent eigen-subspace of the  $N$ -dimensional viewpoint dependent non-eigen-subspace resulting from said warp, according to the equation:

$$R(x, y) = \sum_{p=1}^M \bar{\Psi}_p(x) \bar{\sigma}_p \bar{\Psi}_p(y)$$

where

$$\bar{\sigma}_p \bar{\Psi}_p(x) = \sum_{r=1}^N U_{pr} \tilde{\Psi}_r(x)$$

where  $\bar{\sigma}_p$  and  $U_{pr}$  are determined by the eigenvalue decomposition of an  $N \times N$  matrix  $B_{rs}$  where

$$B_{rs} = \sum_x \tilde{\Psi}_r(x) \sigma_r \sigma_s \tilde{\Psi}_s(x) = U_{pr} \sigma_p^2 U_{ps}$$

9. The method of claim 8, comprising:

the final dimensionality of the viewpoint dependent subspace,  $M$ , having a value up to 20.

10. The method of claim 9, comprising:

the final dimensionality of the viewpoint dependent subspace,  $M$ , having a value between 4 and 9, inclusive.

11. The method of claim 8, comprising:

having the value of  $N$  not less than 2 times the value of  $M$ , and not more than 8 times the value of  $M$ .
